

What is a three dimensional drawing? We sketch / draw with a pencil, a pen or even a paintbrush on a flat surface. The line running along a two-dimensional surface may protrude from it a little if it is stitched with sewing thread, wool or string. But a drawing can only be termed three dimensional when located in space. In space, its negative (void) and positive (the line) become one with a shape. A wire, a branch or a root - materials I've worked with for years - are used here, together with the construction and surrounding space to draw a form or to create a sculpture. In this group of drawings one can also see curving lines, spirals holding a void - and, perhaps, even an echo of other worlds, microscopic worlds from the fields of chemistry, physics and biology
